

PROTECTOR 100 CAB

The supercompact "Protector 100" (1740 cm) with digitally controlled pressurisation offers easy access. The Protector 100 can be fitted with a radio, cigarette lighter and a rear lighting

system integrated onto the roof. The steel "butterfly" profile frame with constant radius curvature ensures a streamlined design without sharp edges. Two windows in the front give visibility over the wheels during the work phase. Pressurisation is guaranteed by the vehicle's complete sealing thanks to the suspended controls inside the cab.

AIR CONTROL, the digital control of the pressurisation, guarantees its efficient functioning. The liquid crystal display keeps the operator constantly up to date on the

system's efficiency: it invites the operator to wait a couple of seconds before starting off to make sure the interior is perfectly pressurised; it indicates the time of use and the remaining life of the active carbon filters that totally absorb all kinds of fine chemical; it signals the internal pressure values that must not fall below a certain threshold in order to guarantee the right degree of isolation from external agents. The air that is breathed in the Protector 100 cab whilst working with pesticides is purified. The "Protector 100" is homologated in accordance with the safety legislation 86/298/CEE.
